

# TCGA-KIRC, contrast CT (public TCIA), axial: ledger → image grounding → final lesions

--- ledger lesion (before)   
 --- final lesion (after)   
 --- grown on 3:1 evidence   
 --- candidate (colour = identity)

Per-candidate voxel posterior  $q_c \cdot \sigma(\text{logit } \pi_v + \lambda_c)$ ,  $\pi_v = 0.75$  inside the candidate, 0.25 around it
